

Flow-Liner®

“Goes to School”

With a Pipe Lining Technology Answer

HISTORY

Stratford University is a private educational institution. For over three decades they have specialized in many educational curriculums including information technology, hospitality, culinary arts, business administration, health sciences, and nursing. Stratford has several campuses, including this campus located in historic Virginia just outside of Washington, DC, Stratford University is the ideal place to fulfill academic and professional goals.

Problem:

The property management company in charge of building maintenance for the University was looking for a non-invasive way to repair 4 inch cast iron storm drain

Issues:

The pipe was located under the concrete floor in areas of the building where accessibility was very limited. Excavating the concrete would be very disruptive to the Universities day to day activities.

Solution:

Utilizing Flow-Liner® technology, a Flow-Liner® Certified Installer will re-line the deteriorated cast iron storm drain without excavation or demolition to the concrete floor.

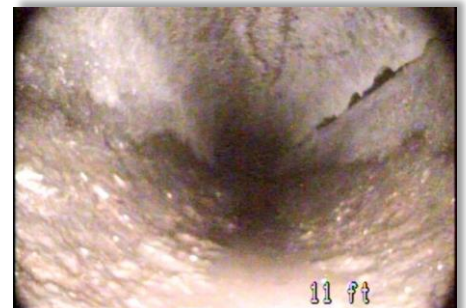

Result:

The storm pipe was lined successfully without disrupting the University. The property management company was very pleased with the result and forwarded Flow-Liner® the following compliment letter;

“Your product saved us from costly excavation under the main building slab...we highly recommend your pipe liner and consider it a valuable option. We will look to you in the future should we face similar circumstances.”

Flow-Liner® being installed

Before pipe was lined

After pipe was lined

We are pleased to announce another successful project and proudly add

Stratford University & USP Management

to our list of happy and satisfied customers.
